

Strategic Challenge Map

Categorise the challenges, evidence each one with a date, judge what you can actually move, then say what would count as proof.

BEST FOR A CHALLENGE, A PROJECT · GREGGLE'S OWN SYNTHESIS · TAKES A DAY, DONE PROPERLY

HOW TO RUN IT

1. Write the strategic context in a paragraph: what the organisation has to keep running, what it is trying to change, and the pressure it is under while doing both. Then name what you must not position against: the people, systems and decisions that are off the table.
2. Work four categories in turn: technological, regulatory, competitive and commercial, organisational. Under each, list the challenges, at least two, stated as things that are the case rather than things you dislike.
3. For every challenge, cite the evidence that it is real and the date that evidence carries. A challenge with no citation is an opinion.
4. For every challenge, say whether your proposal removes it, reduces it, or does not touch it, and justify the verdict mechanically: what changes that makes this stop being true. Then name the proof a sceptical expert would insist on.
5. Rank the challenges by urgency, driven by deadlines and consequences. Everything critical means nothing is. For each, judge how well a lightweight intervention fits versus changing something at the core.
6. Define the proof: the metrics that would satisfy the sceptic, each stated so two people would collect the same number, sorted by the kind of doubt it answers, with the artefact you would put in front of them.

Where it falls down. Without the evidence step it becomes a list of fears.

WITH A PEN

Context

Keep running, change, pressure. What you must not position against

Technological

Challenge / evidence + date / remove, reduce, not touch / proof

Regulatory

Organisational

Where 'does not touch it' is most often true

Competitive and commercial

Ranking, by urgency

Deadlines and consequences, not interest

Definition of proof

Metrics a sceptic would demand, and how each is shown
